

Final Project Statement

My idea for my final project is to make an application that will be an eCommerce platform. Where a user can upload a picture of an item, name and description then be able to sell it on this app. There are two ways I can go about this that I have yet to fully decide on. Option one is by making a fullstack application. Making the database from scratch, the gui front end and a backend to connect these. Or using a web hosting service such as AWS and making a website, and database.

Full Stack

- More familiar with all the components
- Java, MYSQL DB, Maven
 - Start off with MYSQL and transition to AZUREDB?

Web Hosting

- More realistic for what I'd have to do for a job
- Not very familiar with CSS, JS, REACT or AWS/AZURE
 - Database can be hosted on AWS
- AWS only lets you use a free trial (same with AZURE)
- Live website possibility

Possible API's

- Paypal/Square
- Shopify
- Google Maps (item location)
- Woocommerce
